# Nash equilibrium

```
Consider a 2-player game \Gamma = (A_1, A_2, u_1, u_2).

Let X = \Delta(A_1) and Y = \Delta(A_2).

(\Delta(A) is the set of probability distributions over A)
```

# Nash equilibrium

Consider a 2-player game 
$$\Gamma = (A_1, A_2, u_1, u_2)$$
.  
Let  $X = \Delta(A_1)$  and  $Y = \Delta(A_2)$ .  
 $(\Delta(A)$  is the set of probability distributions over  $A$ )

A Nash equilibrium is a mixed strategy profile  $\sigma = (x, y) \in X \times Y$  such that, for every  $x' \in X$ ,  $y' \in Y$ , it holds

$$U_1(x,y) \geqslant U_1(x',y) \text{ and } U_2(x,y) \geqslant U_2(x,y')$$

Consider a 2-player game  $\Gamma = (A_1, A_2, u_1, u_2)$ 

Consider a 2-player game 
$$\Gamma = (A_1, A_2, u_1, u_2)$$
  
Let  $n = |A_1|$  and  $m = |A_2|$ .

Consider a 2-player game 
$$\Gamma = (A_1, A_2, u_1, u_2)$$
  
Let  $n = |A_1|$  and  $m = |A_2|$ .  
 $x \in X$  is a probability distribution:  
 $x = (x_1, \dots, x_n), x_i \ge 0$  and  $x_1 + \dots + x_n = 1$ 

```
Consider a 2-player game \Gamma = (A_1, A_2, u_1, u_2)

Let n = |A_1| and m = |A_2|.

x \in X is a probability distribution:

x = (x_1, \dots, x_n), x_i \geqslant 0 and x_1 + \dots + x_n = 1

y \in Y is a probability distribution:

y = (y_1, \dots, y_m), y_i \geqslant 0 and y_1 + \dots + y_m = 1
```

Consider a 2-player game 
$$\Gamma = (A_1, A_2, u_1, u_2)$$
  
Let  $n = |A_1|$  and  $m = |A_2|$ .  
 $x \in X$  is a probability distribution:  
 $x = (x_1, \dots, x_n), x_i \ge 0$  and  $x_1 + \dots + x_n = 1$   
 $y \in Y$  is a probability distribution:  
 $y = (y_1, \dots, y_m), y_j \ge 0$  and  $y_1 + \dots + y_m = 1$ 

Utilities can be described by a  $n \times m$  matrix R, for the row player, and C, for the column player. Then,

Consider a 2-player game 
$$\Gamma = (A_1, A_2, u_1, u_2)$$
  
Let  $n = |A_1|$  and  $m = |A_2|$ .  
 $x \in X$  is a probability distribution:

# Computing a best response

For a given  $x \in X$ , we have to solve:

For a given  $x \in X$ , we have to solve:

$$\max \quad x^T R y$$
 Subject to:  $y_1 + \cdots + y_m = 1, \ y_j \geqslant 0.$ 

For a given  $x \in X$ , we have to solve:

$$\max \quad x^T R y$$
 Subject to:  $y_1 + \cdots + y_m = 1, \ y_j \geqslant 0.$ 

For a given y, we have to solve:

For a given  $x \in X$ , we have to solve:

$$\max \quad x^T R y$$
 Subject to:  $y_1 + \cdots + y_m = 1, \ y_j \geqslant 0.$ 

For a given y, we have to solve:

$$\max \quad x^T C y$$
Subject to:  $x_1 + \dots + x_n = 1, x_i \ge 0$ 

For a given  $x \in X$ , we have to solve:

$$\max \quad x^T R y$$
 Subject to:  $y_1 + \cdots + y_m = 1, \ y_j \geqslant 0.$ 

For a given y, we have to solve:

$$\max \quad x^T C y$$
Subject to:  $x_1 + \dots + x_n = 1, x_i \ge 0$ 

Those are linear programming problems, so

For a given  $x \in X$ , we have to solve:

$$\max \quad x^T R y$$
Subject to:  $y_1 + \cdots + y_m = 1, y_j \ge 0.$ 

For a given y, we have to solve:

$$\max \quad x^T C y$$
Subject to:  $x_1 + \dots + x_n = 1, x_i \ge 0$ 

Those are linear programming problems, so A best response can be computed in polynomial time for 2-player games with rational utilities.

## ZS: Nash conditions

•  $(x^*, y^*)$  is a NE

• 
$$(x^*, y^*)$$
 is a NE  
 $(x^*)^T R y^* \geqslant x^T R y^*$ , for  $x \in X$ ,  
 $(x^*)^T C y^* \geqslant (x^*)^T C y$ , for  $y \in Y$ .

•  $(x^*, y^*)$  is a NE  $(x^*)^T R y^* \geqslant x^T R y^*, \text{ for } x \in X,$   $(x^*)^T C y^* \geqslant (x^*)^T C y, \text{ for } y \in Y.$ 

• As C = -R the second equation becomes

•  $(x^*, y^*)$  is a NE

$$(x^*)^T R y^* \geqslant x^T R y^*$$
, for  $x \in X$ ,  $(x^*)^T C y^* \geqslant (x^*)^T C y$ , for  $y \in Y$ .

• As C = -R the second equation becomes

$$(x^*)^T R y^* \leqslant (x^*)^T R y$$
, for  $y \in Y$ .

•  $(x^*, y^*)$  is a NE

$$(x^*)^T R y^* \geqslant x^T R y^*$$
, for  $x \in X$ ,  $(x^*)^T C y^* \geqslant (x^*)^T C y$ , for  $y \in Y$ .

• As C = -R the second equation becomes

$$(x^*)^T R y^* \leqslant (x^*)^T R y$$
, for  $y \in Y$ .

Combining both,

$$x^T R y^* \leqslant (x^*)^T R y^* \leqslant (x^*)^T R y$$
, for  $x \in X$ ,  $y \in Y$ .

•  $(x^*, y^*)$  is a NE

$$(x^*)^T R y^* \geqslant x^T R y^*$$
, for  $x \in X$ ,  $(x^*)^T C y^* \geqslant (x^*)^T C y$ , for  $y \in Y$ .

• As C = -R the second equation becomes  $(x^*)^T R y^* \leq (x^*)^T R y$ , for  $y \in Y$ .

Combining both,

$$x^T R y^* \leqslant (x^*)^T R y^* \leqslant (x^*)^T R y$$
, for  $x \in X$ ,  $y \in Y$ .

i.e.,  $(x^*, y^*)$  is a saddle point of the function  $x^T R y$  defined over  $X \times Y$ .

# Minimax inequality

#### Theorem

For any function  $\Phi: X \times Y : \to \mathbb{R}$ , we have

$$\sup_{x \in X} \inf_{y \in Y} \Phi(x, y) \leqslant \inf_{y \in Y} \sup_{x \in X} \Phi(x, y).$$

#### Theorem

For any function  $\Phi: X \times Y : \to \mathbb{R}$ , we have

$$\sup_{x \in X} \inf_{y \in Y} \Phi(x, y) \leqslant \inf_{y \in Y} \sup_{x \in X} \Phi(x, y).$$

## Proof.

#### Theorem

For any function  $\Phi: X \times Y : \to \mathbb{R}$ , we have

$$\sup_{x \in X} \inf_{y \in Y} \Phi(x, y) \leqslant \inf_{y \in Y} \sup_{x \in X} \Phi(x, y).$$

## Proof.

For every  $x' \in X$ ,  $\Phi(x', y) \leqslant \sup_{x \in X} \Phi(x, y)$ 

#### **Theorem**

For any function  $\Phi: X \times Y : \to \mathbb{R}$ , we have

$$\sup_{x \in X} \inf_{y \in Y} \Phi(x, y) \leqslant \inf_{y \in Y} \sup_{x \in X} \Phi(x, y).$$

## Proof.

For every 
$$x' \in X$$
,  $\Phi(x', y) \leqslant \sup_{x \in X} \Phi(x, y)$ 

$$\inf_{y\in Y}\Phi(x',y)\leqslant\inf_{y\in Y}\sup_{x\in X}\Phi(x,y).$$

4) Q C

#### **Theorem**

For any function  $\Phi: X \times Y : \to \mathbb{R}$ , we have

$$\sup_{x \in X} \inf_{y \in Y} \Phi(x, y) \leqslant \inf_{y \in Y} \sup_{x \in X} \Phi(x, y).$$

#### Proof.

For every  $x' \in X$ ,  $\Phi(x', y) \leq \sup_{x \in X} \Phi(x, y)$ 

$$\inf_{y\in Y}\Phi(x',y)\leqslant\inf_{y\in Y}\sup_{x\in X}\Phi(x,y).$$

Taking the supremum over  $x' \in X$  on the left hand-side we get the inequality.  $\Box$

# ZS: Nash conditions

We have

#### We have

•  $x^T R y^* \leqslant (x^*)^T R y^* \leqslant (x^*)^T R y$ , for  $x \in X$ ,  $y \in Y$ .

#### We have

- $x^T R y^* \leqslant (x^*)^T R y^* \leqslant (x^*)^T R y$ , for  $x \in X$ ,  $y \in Y$ .
- Thus

$$\sup_{x \in X} x^T R y^* \leqslant (x^*)^T R y^* \leqslant \inf_{y \in Y} (x^*)^T R y$$

#### We have

- $x^T R y^* \leqslant (x^*)^T R y^* \leqslant (x^*)^T R y$ , for  $x \in X$ ,  $y \in Y$ .
- Thus

$$\sup_{x \in X} x^T R y^* \leqslant (x^*)^T R y^* \leqslant \inf_{y \in Y} (x^*)^T R y$$

$$\inf_{y \in Y} \sup_{x \in X} x^T R y \leqslant \sup_{x \in X} x^T R y^* \leqslant (x^*)^T R y^* \leqslant \inf_{y \in Y} (x^*)^T R y \leqslant \sup_{x \in X} \inf_{y \in Y} x^T R y$$

#### We have

- $x^T R y^* \leqslant (x^*)^T R y^* \leqslant (x^*)^T R y$ , for  $x \in X$ ,  $y \in Y$ .
- Thus

$$\sup_{x \in X} x^T R y^* \leqslant (x^*)^T R y^* \leqslant \inf_{y \in Y} (x^*)^T R y$$

$$\inf_{y \in Y} \sup_{x \in X} x^T R y \leqslant \sup_{x \in X} x^T R y^* \leqslant (x^*)^T R y^* \leqslant \inf_{y \in Y} (x^*)^T R y \leqslant \sup_{x \in X} \inf_{y \in Y} x^T R y$$

• Using the minimax inequality, we get

#### We have

- $x^T R y^* \leqslant (x^*)^T R y^* \leqslant (x^*)^T R y$ , for  $x \in X$ ,  $y \in Y$ .
- Thus

$$\sup_{x \in X} x^T R y^* \leqslant (x^*)^T R y^* \leqslant \inf_{y \in Y} (x^*)^T R y$$

$$\inf_{y \in Y} \sup_{x \in X} x^T R y \leqslant \sup_{x \in X} x^T R y^* \leqslant (x^*)^T R y^* \leqslant \inf_{y \in Y} (x^*)^T R y \leqslant \sup_{x \in X} \inf_{y \in Y} x^T R y$$

Using the minimax inequality, we get

$$\inf_{y \in Y} \sup_{x \in X} x^T R y = (x^*)^T R y^* = \sup_{x \in X} \inf_{y \in Y} x^T R y$$

#### We have

- $x^T R y^* \leqslant (x^*)^T R y^* \leqslant (x^*)^T R y$ , for  $x \in X$ ,  $y \in Y$ .
- Thus

$$\sup_{x \in X} x^T R y^* \leqslant (x^*)^T R y^* \leqslant \inf_{y \in Y} (x^*)^T R y$$

$$\inf_{y \in Y} \sup_{x \in X} x^T R y \leqslant \sup_{x \in X} x^T R y^* \leqslant (x^*)^T R y^* \leqslant \inf_{y \in Y} (x^*)^T R y \leqslant \sup_{x \in X} \inf_{y \in Y} x^T R y$$

• Using the minimax inequality, we get

$$\inf_{y \in Y} \sup_{x \in X} x^T R y = (x^*)^T R y^* = \sup_{x \in X} \inf_{y \in Y} x^T R y$$

We refer to  $\inf_{y \in Y} \sup_{x \in X} x^T R y$  as the value of the game.

# ZS: algorithm for finding NE

• For a fixed y, we have

• For a fixed y, we have

$$\max_{x \in X} x^T R y = \max_{i=1,\dots,n} \{ [Ry]_i \},\$$

• For a fixed y, we have

$$\max_{x \in X} x^T R y = \max_{i=1,\dots,n} \{ [Ry]_i \},\$$

therefore

$$\min_{y \in Y} \max_{x \in X} x^T R y = \min_{y \in Y} \max\{ [Ry]_1, \dots [Ry]_n \}$$

• For a fixed y, we have

$$\max_{x \in X} x^T R y = \max_{i=1,\dots,n} \{ [Ry]_i \},$$

therefore

$$\min_{y \in Y} \max_{x \in X} x^T R y = \min_{y \in Y} \max\{ [Ry]_1, \dots [Ry]_n \}$$

 So, both the value of the game and a Nash equilibrium strategy for player 2 can be obtained by solving the linear programming problem:

For a fixed y, we have

$$\max_{x \in X} x^T R y = \max_{i=1,\dots,n} \{ [Ry]_i \},$$

therefore

$$\min_{y \in Y} \max_{x \in X} x^T R y = \min_{y \in Y} \max\{ [Ry]_1, \dots [Ry]_n \}$$

 So, both the value of the game and a Nash equilibrium strategy for player 2 can be obtained by solving the linear programming problem:

$$v\mathbf{1}_n \geqslant Ry, y \in Y$$
.

Similarly, we have

$$\max_{x \in X} \min_{y \in Y} x^T R y = \max_{x \in X} \min\{[R^T x]_1, \dots [R^T]_n\}$$

Similarly, we have

$$\max_{x \in X} \min_{y \in Y} x^T R y = \max_{x \in X} \min\{[R^T x]_1, \dots [R^T]_n\}$$

• So, a Nash equilibrium strategy for player 1 can be obtained by solving the linear programming problem:

Similarly, we have

$$\max_{x \in X} \min_{y \in Y} x^T R y = \max_{x \in X} \min\{[R^T x]_1, \dots [R^T]_n\}$$

 So, a Nash equilibrium strategy for player 1 can be obtained by solving the linear programming problem:

$$\max w$$
$$w\mathbf{1}_m \leqslant R^T x, x \in X.$$

Similarly, we have

$$\max_{x \in X} \min_{y \in Y} x^T R y = \max_{x \in X} \min\{[R^T x]_1, \dots [R^T]_n\}$$

 So, a Nash equilibrium strategy for player 1 can be obtained by solving the linear programming problem:

$$\max w$$
$$w\mathbf{1}_m \leqslant R^T x, x \in X.$$

 LP can be solved efficiently, thus there is a polynomial time algorithm for computing NE for zero-sum games.

# A PPAD-complete problem

End-of-Line

#### End-of-Line

Given an implicit representation of a graph G with vertices of degree at most 2 and a vertex  $v \in G$ , where v has in degree 0. Find a node  $v' \neq v$ , such that v' has out degree 0.

#### End-of-Line

Given an implicit representation of a graph G with vertices of degree at most 2 and a vertex  $v \in G$ , where v has in degree 0. Find a node  $v' \neq v$ , such that v' has out degree 0.

 Since every node has degree 2, it is a collection of paths and cycles.

#### End-of-Line

Given an implicit representation of a graph G with vertices of degree at most 2 and a vertex  $v \in G$ , where v has in degree 0. Find a node  $v' \neq v$ , such that v' has out degree 0.

- Since every node has degree 2, it is a collection of paths and cycles.
- We know that Every directed graph with in/outdegree 1 and a source, has a sink.

#### End-of-Line

Given an implicit representation of a graph G with vertices of degree at most 2 and a vertex  $v \in G$ , where v has in degree 0. Find a node  $v' \neq v$ , such that v' has out degree 0.

- Since every node has degree 2, it is a collection of paths and cycles.
- We know that Every directed graph with in/outdegree 1 and a source, has a sink.
- Which guarantees that the End-of-Line problem has always a solution.

# End-of-Line: graph representation

- G is given implicitly by a circuit C
- C provides a predecessor and successor pair for each given vertex in G, i.e. C(u) = (v, w).
- A special label indicates that a node has no predecessor/successor.

### NE characterization

#### Theorem

In a strategic game in which each player has finitely many actions a mixed strategy profile  $\sigma^*$  is a NE iff, for each player i,

- the expected payoff, given  $\sigma_{-i}$ , to every action in the support of  $\sigma_i^*$  is the same
- the expected payoff, given  $\sigma_{-i}$ , to every action not in the support of  $\sigma_i^*$  is at most the expected payoff on an action in the support of  $\sigma_i^*$ .

## NE conditions given support

Let  $A \subseteq \{1, \dots n\}$  and  $B \subseteq \{1, \dots m\}$ .

The conditions for having a NE on this particular support can be written as follows:

$$\max \lambda_1 + \lambda_2$$

Subject to:

$$[R y]_i = \lambda_1$$
, for  $i \in A$   
 $[R y]_i \leqslant \lambda_1$ , for  $i \notin A$   
 $j[C x] = \lambda_2$ , for  $j \in B$   
 $j[C x] \leqslant \lambda_2$ , for  $j \notin B$ 

# Iterating over all supports

• For every possible combination of supports  $A \subseteq \{1, \dots n\}$  and  $B \subseteq \{1, \dots m\}$ .

Solve the set of simultaneous equations using linear programming.

# Iterating over all supports

programming.

- For every possible combination of supports  $A\subseteq\{1,\ldots n\}$  and  $B\subseteq\{1,\ldots m\}$ . Solve the set of simultaneous equations using linear
- This is an exact exponential time algorithm as the number of supports can be exponential.

# Iterating over all supports

- For every possible combination of supports A ⊆ {1,...n} and B ⊆ {1,...m}.
   Solve the set of simultaneous equations using linear programming.
- This is an exact exponential time algorithm as the number of supports can be exponential.
- The same algorithm can be applied to a multiplayer game.
   We would be able to compute a NE on rationals if such a NE exists.
